## CLAIMS

1. A process for preparing a cephalosporin of formula

(I)

10

5

in which  $R^1$  is H or Na and  $R^2$  is chosen from the group consisting of H,  $CH_3$ ,  $CH_2OCOCH_3$ ,  $CH_2OCOCH_3$ ,  $CH=CH_2$ ,

15

20

25

according to which a compound of formula (II)

H<sub>2</sub>N S (II)

30

in which  $\ensuremath{\mbox{R}^2}$  has the aforestated meanings is silylated at the carboxyl to give the corresponding

trialkylsilyl-ester which is reacted with a compound of
formula (III)

in which X is Cl or Br and Y is Cl, or  $O-CH=N^+\left(CH_3\right)_2\ Cl^-$  to give a cephalosporin of formula (IV)

in which X and  $R^2$  have the aforestated meanings, and  $R^3$  is trialkylsilyl, which is hydrolyzed at pH  $7 \div 7.5$  and then treated in a partly aqueous solution with benzathine or a salt thereof, to obtain crystallization of a new cephalosporin of formula (V)

25 
$$\times$$
 OCH<sub>3</sub>  $\times$  HN  $\times$  R  $^2$  (V)

where Z is benzathine, in which the carboxyl is salified by the benzathine, this salt being filtered off, washed with water and reacted in a partly aqueous

solvent with thiourea, to lead to the formation of the 2-(2-aminothiazol-4-yl)-2-methoxyiminoacetic chain and give a solution of the compound of general formula (I) in which  $R^2$  has the aforestated meanings and  $R^1$  is H, the compound of formula (I) being crystallized from this solution in the form of the sodium salt, of the salt of a pharmaceutically acceptable inorganic acid or of an internal salt.

- 2. A process according to claim 1, wherein simultaneously with the formation of the 2-(2-aminothiazol-4-yl)-2-methoxyyminoacetic chain, there is the precipitation of benzathine hydrochloride which is filtered off and removed to leave a very pure solution of the compound of general formula (I).
- 3. A process as claimed in claim 1, wherein a product of formula (I) is obtained in which  $R^1$  is H or Na and  $R^2$  is chosen from the group consisting of H,  $CH_3$ ,  $CH_2OCH_3$ ,  $CH_2OCOCH_3$ ,  $CH=CH_2$

4. A process as claimed in claim 2, wherein a product of formula (I) is obtained in which  $R^1$  is H or Na and  $R^2$  is chosen from the group consisting of H,  $CH_3$ ,  $CH_2OCH_3$ ,  $CH_2OCOCH_3$ ,  $CH=CH_2$ 

5. The benzathine salt of a cephalosporin of formula (V)

where Z, X and R<sup>2</sup> are as specified in claim 1.
A process for preparing the benzathine salt of a cephalosporin of formula (V) of claim 5, according to which a compound of formula (II)

$$H_2N$$
 $R^2$ 
(II)

in which  $R^2$  has the aforestated meanings, is silylated at the carboxyl to give the corresponding trialkylsilyl-ester which is reacted with a compound of formula (III)

$$X-CH_2-CO-C-CO-Y$$
|
|
NOCH<sub>3</sub>

in which X is Cl or Br and Y is Cl, or  $\label{eq:charge} \text{O-CH=N}^+\text{(CH}_3\text{)}_2\text{ Cl}^-$  to give a cephalosporin of formula (IV)

20

25

30

in which X and  $R^2$  are as specified in claim 1, and  $R^3$  is trialkylsilyl, which is hydrolyzed at pH  $7\div7.5$  and then treated in a partly aqueous solution with benzathine or a salt thereof, thus obtaining crystallization of a cephalosporin of formula (V) in which the carboxyl is salified by the benzathine, this salt being filtered off and washed with water.
